

POSSIBLE SIDE EFFECTS OF SCAR AND STRETCH MARK TREATMENT

- A low risk of prolonged itching, redness and blistering
- A risk of darkening or lightening of the area being treated
- Burns, bruising, or blistering may occur, some of which may result in scarring
- Temporary redness or swelling immediately after treatment
- Bronzing, which is brown debris on the surface of the skin, may develop a few days after treatment.
- Risk of infection following treatment, potentially resulting in side effects mentioned above.
- Acne breakouts
- Reduced social downtime
